2015 - 2018

EDUCATION

B.Sc. Computer Science

Technion, Haifa

2011 - 2015

LANGUAGES

Hebrew

Native

English

Fluent

Summary

Eight years in engineering: four building fullstack products in React/Node, four leading DevOps. Brings a developer's view to infrastructure — pipelines, environments and tooling designed for the people who ship code. Currently DevOps lead for a 25-engineer R&D group.

Experience

DevOps Lead · Argaman Networks, Petah Tikva

2022 - Present

- Lead DevOps team of 4; own CI/CD, Kubernetes and AWS infrastructure for the whole R&D group.
- Migrated deployment from bash-over-SSH to Helm + ArgoCD on EKS; deploy time 45 min → 7 min, rollback is one click.
- Moved all AWS infrastructure to Terraform across 3 environments; manual console changes eliminated.
- Built GitHub Actions pipelines with test, lint and security gates for every repository; broken-main incidents dropped sharply.
- Set up Prometheus + Grafana + PagerDuty from scratch; introduced on-call rotation and wrote the first runbooks.
- 99.95% uptime on customer-facing services over the last 12 months.
- Cut monthly AWS bill 22% through rightsizing, spot node groups and S3 lifecycle policies.
- Still ship product code when it helps: built the internal admin panel (React + Node) used daily by the support team.

Fullstack Developer · BitSage, Tel Aviv

2018 - 2022

- Developed core banking-integration product in React, Node.js/Express and PostgreSQL.
- Owned the payments-reconciliation module end to end: API design, DB schema, background jobs, UI.
- Implemented GraphQL gateway consolidating 6 internal REST services behind one schema.
- Added Redis caching layer for account lookups; p95 latency 900ms → 120ms.
- Containerized the main service and wrote its first CI pipeline — the project that pulled me toward DevOps.
- Mentored two junior developers; ran the team's weekly code-review session.

Software Developer · IDF, Mamram

2015 - 2018

- Fullstack development on internal logistics systems (Java backend, later Node.js; web frontend).
- Mamram software course graduate; served as team's deployment and environments owner in final year.

Selected Projects

- **Preview environments:** per-PR ephemeral namespaces on EKS with seeded data and TTL cleanup; QA verification moved from shared staging to isolated envs.
- **Secrets overhaul:** migrated hard-coded configs to AWS Secrets Manager + external-secrets operator across ~30 services.

- **Developer CLI:** internal Node.js CLI wrapping deploy, logs and port-forward commands; adopted by all product teams.
